NATURALLY RESOURCEFUL

RenewEn USA Introduces Wind Turbines For Your Future

Renewable energy sources is the best way to help our atmosphere against dangerous threats of natural disasters such as global warming. Renewable energy is energy generated from natural resources such as sunlight, wind, rain, tides, and geothermal heat. The different types of renewable energy sources are: biofuels, biomass, geothermal, hydro power, solar power, tidal power, wave power, and wind power. All these examples of renewable energy sources are suggested to be utilized, yet *RenewEn USA* focuses on wind power. *Wind power is growing at the rate of 30 percent annually, and is widely used in several European countries and the United States. Airflows can be used to run wind turbines. The power output of a turbine is a function of the cube of the wind speed, so as wind speed increases, power output increases dramatically. Wind power is renewable and doesn't produce greenhouse gases during operation such as, carbon dioxide and methane. *RenewEn USA* is a new nation-wide non-for-profit organization, a division of the famous *RenewEn International*, promoting renewable energy sources. *RenewEn USA* are helping citizens like you realize how important it is to save our environment and turn to renewable energy sources, such as wind power, for aid. Visit us NOW for more information on how you can contribute in saving our environment! *Wind power information located on our website*
